EmpathyLens PROTOTYPE

Explore accessibility beyond visual design

Guided experience · 7 steps

WELCOME

A website can look accessible and still leave people behind.

EmpathyLens is an interactive awareness prototype that helps developers understand how blind users may experience websites through screen readers.

> *"I can see the page, but can I understand it without seeing it?"*

Meet Yasmin: Imagine applying for a job using a screen reader. If buttons have no meaningful names or form fields have no labels, completing a simple task can become confusing.

Start the experience →

What you'll explore

Preview a sample interface, read a scripted screen-reader-style transcript, and compare examples of unclear and improved controls.

Why it matters

Inclusive design considers how people navigate, understand and interact with a page—not only how it looks.

DESIGN REFLECTION DEMO

Use the reflection area on the comparison screen to explore a possible feedback workflow.

No submission or database connection is active.

EXAMPLE USER FEEDBACK

"I couldn't tell what the icon-only buttons did. Clear names would help me understand each action."

— Sample persona feedback

Fictional example, not a real user review.

PROTOTYPE SCOPE

- Front-end demonstration only
- Sample results and transcripts
- No login or user database
- No permanent project storage
- No automated accessibility scan

EmpathyLens PROTOTYPE

Explore accessibility beyond visual design

Guided experience · 7 steps

Choose an HTML example

Upload a small HTML file, paste your own markup, or start with the built-in example. Your code is previewed locally in this page.

1. Add your HTML

Choose an HTML file

Choose File No file chosen

Loaded built-in example.

HTML source

```
<!doctype html>
<html lang="en"><head><title>Junior UX Designer</title></head>
<body>
<h2>Junior UX Designer</h2>
<img src="https://placehold.co/100x60" alt="">
<input placeholder="Full name"><input placeholder="Email address">
<button type="button"><span aria-hidden="true">↑</span></button>
<button type="button"><span aria-hidden="true">→</span></button>
</body></html>
```

Load sample | Preview HTML

2. Visual preview

Junior UX Designer

Explore accessibility beyond visual design

Guided experience · 7 steps

Example findings

Demo result: 4 example controls reviewed. 2 are shown with missing or unclear accessible names. These values are fixed sample data, not calculated from your uploaded code.

Interaction analysis

What is visible	Example announcement	Suggested improvement
Icon-only upload control	"Button"	Needs review Add a meaningful accessible name, such as "Upload resume".
Icon-only submit control	"Button"	Needs review Give the control a clear name, such as "Submit application".
Name field	"Full name, edit text"	Example OK Associate a visible label with the input.
Email field	"Email address, edit text"	Example OK Use an appropriate input type and label.

EmpathyLens PROTOTYPE

Explore accessibility beyond visual design

Guided experience - 7 steps

“A page that looks clear is not automatically accessible.”

Accessibility is part of making an interface usable. Consider names, labels, keyboard access, focus order, semantic structure and clear feedback.
